- Title: GitLab Login Process Guide
- Introduction: GitLab is a web-based Git repository manager that provides version control, issue tracking, and CI/CD pipelines. To start using GitLab, you need to create an account and login. This guide will walk you through the GitLab login process step by step.
- Step 1: Access the GitLab Website
- Open your web browser and navigate to the GitLab website (http://192.168.10.11/users/sign_in).

- Step 2: Click "Sign in"
- At the top-right corner of the GitLab homepage, click on the "Sign in" button.
- Step 3: Enter Your Username/Email and Password
- Step 5: Click "Sign in"
- After entering your credentials, click on the "Sign in" button to log in to your GitLab account.
- Step 7: Accessing Your Dashboard
- Once you are successfully logged in, you will be directed to your GitLab dashboard.
- From here, you can access your repositories, projects, groups, and other GitLab features.
- Step 8: Logout (When You're Done)

- Create a New Project:
- Click on the "+" icon in the top right corner and select "New Project."
- Choose the appropriate visibility level (private, internal, or public) for your project.
- Fill in the project name, description, and other details.
- Click on "Create Project."

- Clone the Project:
- To work on your project locally, you need to clone the repository. Find the repository's URL on the project page.
- Open your terminal or Git Bash and navigate to the directory where you want to store the project.
- Run the following command, replacing `<repository-url>` with the actual URL:

- `git clone <repository-url>`

- Add and Commit Changes:
- Make changes to your project files.
- Once you are ready to save your changes, use the following commands:

- `git add .` # Add all changes to the staging area
- `git commit -m "Your message"` # Commit changes with a descriptive message

- Push Changes to GitLab:
- To share your changes with others on GitLab, you need to push them to the remote repository.
- Use the following command to push your changes:
- `git push origin master`

- Pull Changes from GitLab:
- If others have made changes to the remote repository, you need to pull those changes to your local repository before pushing your own changes.
- Use the following command to pull changes:

`git pull origin mast`

- Create and Switch Branches:
- Branches allow you to work on separate features or changes without affecting the main codebase.
- To create and switch to a new branch, use the following commands:

- `git checkout -b new-branch` # Create and switch to a new branch
- `git branch` # View available branches and see which one you're on

- Resolve Conflicts:
    - Conflicts can occur when merging branches if changes overlap. Git will notify you of these conflicts and mark them in the affected files.
    - Manually edit the conflicted files to resolve the conflicts.
    - After resolving conflicts, add and commit the changes before pushing.
- Pull Requests (Merge Requests):
- In GitLab, you can use Pull Requests (called Merge Requests) to propose changes and review them before merging.
- On the project page, click "Merge Requests" > "New Merge Request," and choose the source and target branches.
- Add a title and description for the merge request and submit it for review.
- Team members can then review and comment on the changes before merging.
